

Facilitating Desirable Business Change

Maturity Models as Advisory Service

Maturity and Capability Models

Maturity and capability models are widely employed in consulting practices and in organisations to assess the level of maturity or capability with respect to particular domains, including:

- *Software Development Capability*
- *Data Management Capability*
- *Digital Transformation Readiness / Progress*
- *Enterprise Architecture*
- *and many more*

Platform

Inspired has developed a platform, leveraging our Enterprise Value Architect (EVA) toolset, to support the definition, use and evolution of these types of models. This was piloted in 2020 with the unique Pandemic readiness model which Inspired offered to assist organisations in responding quickly to the COVID pandemic.

Early versions just led users through the assessment and produced a score in the form of a radar chart. This capability remains, but has

been made generic, so it is possible to specify dimensions of interest in the model and compute scores based upon a variety of concern areas using user specified formulae.

We wanted to go beyond just doing a maturity or capability assessment and returning a score or graph of status, although these are valuable. Accordingly, we added recommended actions to the model, which are tailored to the current level of maturity discovered by the assessment. In later versions, we also included hyperlinks to allow users to go directly to sources of information, consulting help, training or other resources relative to progressing the actions.

We developed this idea further, to also incorporate relative levels of effort for the various recommendations. It is not possible to provide actual effort, of course, as organisations differ in size, complexity, distribution etc. but relative effort can be determined. This allows us to further filter the recommendations to identify those that are relatively low effort and will improve areas of lowest capability or readiness. Recommendations are stratified into those which should be tackled immediately, a second tier and a “later” tier.

Finally, we wanted to facilitate the rapid development of action plans, so the prioritised actions can be selected by the client, indicating which ones the organisation actually wants to progress. These can come from any priority level. This selection is used to generate a form to gather start and end times for these activities and responsible parties, people and resources relevant to each. This allows generating data for a spreadsheet or project plan to track the activities.

Using this approach, it is possible to go from survey, to scored results, to recommendations, to prioritisation, to resourcing and times and to an action plan in a very rapid way. We do not suggest that the entire process should be done mechanistically, but rather with consultation, group consensus discussions and the like. However, the tool and the knowledge embedded in the model and the recommendation bank is substantial and greatly facilitates the use of these models.

Models can be named and stored for later reference or comparison.

We already have a number of models, including:

- [Pandemic Readiness](#)
- [Data Management Maturity](#)
- [Digital Transformation](#)
- [Enterprise Architecture](#)
- [Business Architecture](#)
- [Application Landscape](#)

Note that not all of these are fully developed with all features yet. We are working with partners to add more models. Please contact us if you are interested in a demonstration or would like to discuss support for a model relevant to you.

Contact

Please feel free to contact us if you would like more information or a demonstration.

Example

We will look at some snippets from a Data Management Maturity model in the tool.

The assessment survey questions are presented in a matrix, as shown below. The blue squares indicate user selections. Selections can be reset, and can, if necessary, span more than one box. The full set of questions is much larger than that shown, of course.

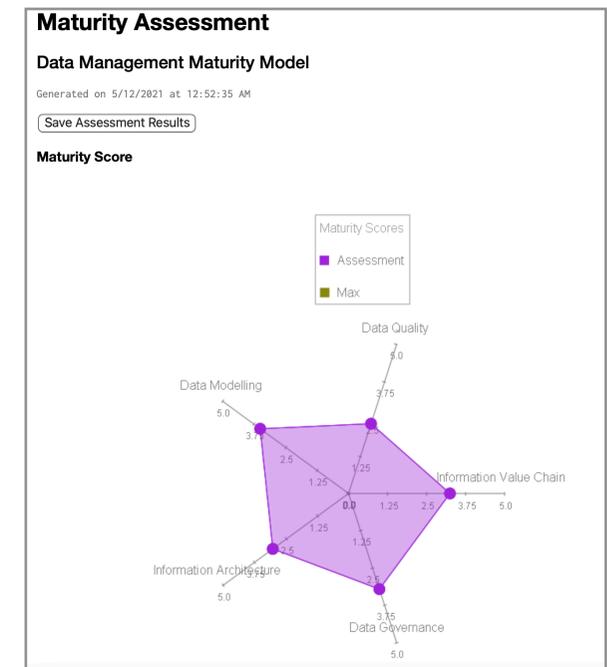

Maturity Assessment
Data Management Maturity Model

Maturity levels increase from left to right. Work down through the rows, left to right, reading each description carefully. Consider whether your organisation is at that level, or has moved past it. Keep moving right until you find a cell you agree with. Mark the cell, and continue to the next row. If you are unsure, you may select two adjacent cells. Once you have selected a level for each concern area, click Submit at the bottom of the page to generate your results and recommended actions.

[More on using Maturity Models](#)

	Maturity Level				
	1	2	3	4	5
We have a data management business function in place.	No, and we don't need it.	No, the IT department does everything related to data.	We are in the process of establishing such a function.	Yes, we have recently established it.	Yes, and it is fully operational.
We have an information/data policy and processes in place.	No, what are those?	No, we do everything on an ad-hoc basis.	We are thinking of developing it.	It is in the development phase.	Yes, we do!
We have a dedicated budget for data management initiatives.	No, why would we need that?	We regulate the funding on an ad-hoc basis.	We are discussing what we should have one next year.	Not right now, but we have it planned for next year.	Yes, we have it (for the current year!)
Our top management is fully aware and involved in data management initiatives.	Why? We don't have any issues with data.	Why? Data management is something only IT should worry about.	A little, our top management is starting to recognise the importance of data management.	Yes, one of our top managers is a sponsor of the data management initiative.	Yes, data management is one of the top priorities in our company.

The maturity level or capability is computed for the dimensions specified in the model and rendered as a radar chart.

Next, a recommendations table is generated for actions which would increase maturity and capability. Each of these has an associated relative effort.

Concern	move from:	move to:	Recommended Actions	Relative Effort
We have a data management business function in place.	3 We are in the process of establishing such a function.	4 Yes, we have recently established it.	Educate parties of expectations of the various data management roles. Formalise the mandate, organisational position, resource and responsibilities of data management function.	Low
We have an information/data policy and processes in place.	2 No, we do everything on an ad-hoc basis.	3 We are thinking of developing it.	Educate senior management on the role of data management function and the requirements for its successful establishment.	Low
We have a dedicated budget for data management initiatives.	3 We are discussing whether we should have one next year.	4 Not right now, but we have it planned for next year.	Define data management process. Establish a suitable budget for data management outside of IT.	Medium

The recommendations are stratified based upon their contribution to areas of low maturity/capability and their relative effort. Items which contribute to improvements in more than one area are boosted in priority. A priority matrix is produced with guidance for those items recommended to tackle immediately, next and in the future. The matrix has hyperlinks to resources which can assist with the actions.

Maturity	Relative Effort			Help Available
	Low	Medium	High	
1.0	Educate senior management on the role of data management function and the requirements for its successful establishment.			ENE Consulting Services
1.0	Identify known issues and document. Put a value/risk to them.			
1.0		Identify and illustrate scenarios where data is (a) missing (b) redundant (c) inaccurate (d) contested (e) at risk (f) inconsistently named or treated (e.g. Different execs talk about the same variable but define it differently) (g) naming is not specific enough (e.g. is this an estimate/actual; immediate/end of month; region/national? etc.)		Consulting Services - Data Advisory
1.0			Scorecard data quality, at least for data identified as important. Use a score across risk, security, privacy, compliance, financial.	

The user can select items in this table to confirm which actions the organisation wishes to take. Submitting these choices results in a form to capture the relevant timeframes and resources to apply to the activities.

Maturity Priority Plan

Enter details below:

Guidance	Start Week	End Week	Resource Names
Educate senior management on the role of data management function and the requirements for its successful establishment	1	2	John M, Mary G
Identify and illustrate scenarios where data is (a) missing (b) redundant (c) inaccurate (d) contested (e) at risk (f) inconsistently named or treated (e.g. Different execs talk about the same variable but define it differently) (g) naming is not specific enough (e.g. is this an estimate/actual; immediate/end of month; region/national? etc.)	3	6	Peter (External), James H
Educate parties of expectations of the various data management roles	4	6	Peter (External), Judy M
Educate parties on the respective roles and responsibilities of business and IT with respect to data	5	7	Peter (External), Judy M

From this information a data file is produced that can be loaded in a spreadsheet or project management package to manage and track the activities.

Guidance Item	Start Week	End Week	Resource Names
Educate senior management on the role of data management function and the requirements for its successful establishment	1	2	John M, Mary G
Identify and illustrate scenarios where data is (a) missing (b) redundant (c) inaccurate (d) contested (e) at risk (f) inconsistently named or treated (e.g. Different execs talk about the same variable but define it differently) (g) naming is not specific enough (e.g. is this an estimate/actual; immediate/end of month; region/national? etc.)	3	6	Peter (External), James H
Educate parties of expectations of the various data management roles	4	6	Peter (External), Judy M
Educate parties on the respective roles and responsibilities of business and IT with respect to data	5	7	Peter (External), Judy M

Alternately, EVA users can generate this data into a Programme format and track it using the Milestone Chart facility, in a view similar to that below:
